

N#CCCN(CCc1ccc(S(N)(=O)=O)cc1)C(=O)c1ccc(-c2cssc2=S)cc1 | ligand_gat + esmc | checkpoint runs\random_pair-gat-frozen-v1\best.pt
head-mean aggregation hides disagreement; these panels show the individual heads so a peak can be judged against how much the heads actually agree
aggregation: last layer, mean over heads, bond contributions split equally between endpoint atoms (derived aggregation) [a69d0443fbd69c13]
Attention-based explanation. NOT an experimentally established contact map, binding pose, or mechanism. The residue x atom view is a derived aggregation.
